

Outdoor seeds

Make use of our handy 'Kiwiseeds Climate Map' that shows the three key areas that marijuana will grow into select the growing conditions. In all areas, the summer months are best suited for marijuana cultivation. So, the right time for growing marijuana is April - October in the northern hemisphere and October – April in the southern hemisphere. The weed usually blooms into shorter days and a majority of the strains are pushed into the blooming process with less than twelve hours of light.

On the other hand, in the warm tropical regions, where light is always around for twelve hours per day, marijuana can be grown all year long. Growers can provide their plants with an additional day-length in the beginning to give a chance for the plant to grow.

If the plant does not get extra light, it will bloom right away, though with a very low yield. Kiwiseeds has an excellent assortment of a wide range of outdoor strains for meeting all your cannabis cultivation needs!

Cannabis seeds by region/climate

Select your region on the map and get the seeds that give the best results in your climate.
